

# Earth Science Atmospheres Subdivision (Code 610AT)

## Mission Statement:

Advance the knowledge and understanding of the atmospheres of the earth and other planets, through scientific research, technology development, and satellite missions

# 610 Atmosphere Laboratories

- ESD\_Atmosphere Office (610AT)  
Interdisciplinary studies: aerosol-water cycle interactions, high impact weather and climate
- Mesoscale Atmospheric Processes Laboratory (612)  
Precipitation, water vapor, aerosols, winds
- Climate and Radiation Laboratory (613)  
Aerosols, clouds, biomass burning and radiation
- Atmospheric Chemistry and Dynamics Laboratory (614)  
Ozone, CH<sub>4</sub> other GHGs, NO<sub>x</sub> , HCHO...
- Wallops Field Support Office (610.W)  
GPM GV facility, suborbital measurements, remote sensing instruments

# Major Activities

## - Satellite Missions

Present: TRMM, EOS/Aqua, Terra, Aura, CloudSAT/CALIPSO ,  
SORCE, NPP...

Planned: GPM, SAGEIII, ACE, GEOCAPE...

## - Field Campaigns

ARCTAS, CATS, HS3, DiscoverAq, ...

## - Modeling

GCE, Nu-WRF, MMF, GESO5, Satellite Simulators....

## - Long-term data development and analysis

Ozone, Precipitation, Aerosol, Clouds, ...

# Aerosol-Climate Prediction

Satellites

frequent, global  
snapshots;  
AOD, aerosol  
air mass type

## Remote-sensing Analysis

- Retrieval Validation
- Assumption Refinement

## Sub-orbital

targeted chemical &  
microphysical detail

## Regional Context

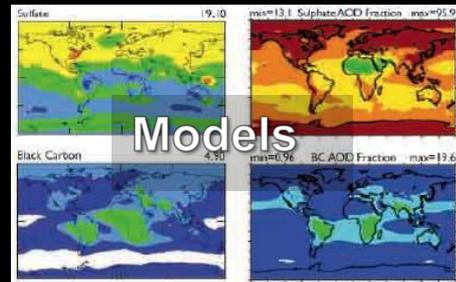

ground obs, mobile  
SMART Labs

## CURRENT STATE

- Initial Conditions
- Assimilation

## Model Validation

- Parameterizations
- Climate Sensitivity
- Underlying mechanisms

Models

space-time interpolation,

**PREDICTION**

# Recent deployment of Mobile SMARTLabs in Vietnam to study aerosol-clouds interaction in Southeast Asia (7SEAS/SEAC<sup>4</sup>Rs)

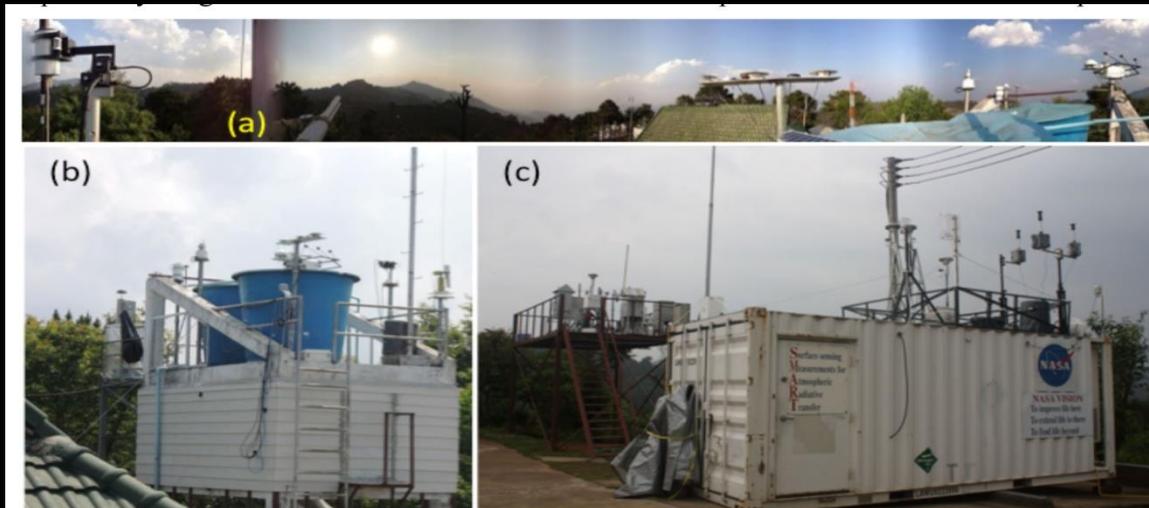

Figure 2. (a) Panoramic view of all radiation instruments at the Doi Angkhang supersite, located at the highest point of the Met. Station water tower, and (b) a simple shelter built on the floor underneath the water tower to host power supplies, dataloggers, computers and daily operations. (c) Major chemistry probes from the Taiwan team were located on the platform next to SMART, which hosted a micro-pulse lidar, additional trace-gas and microphysics instruments with their inlets installed on the roof of SMART mobile laboratory.

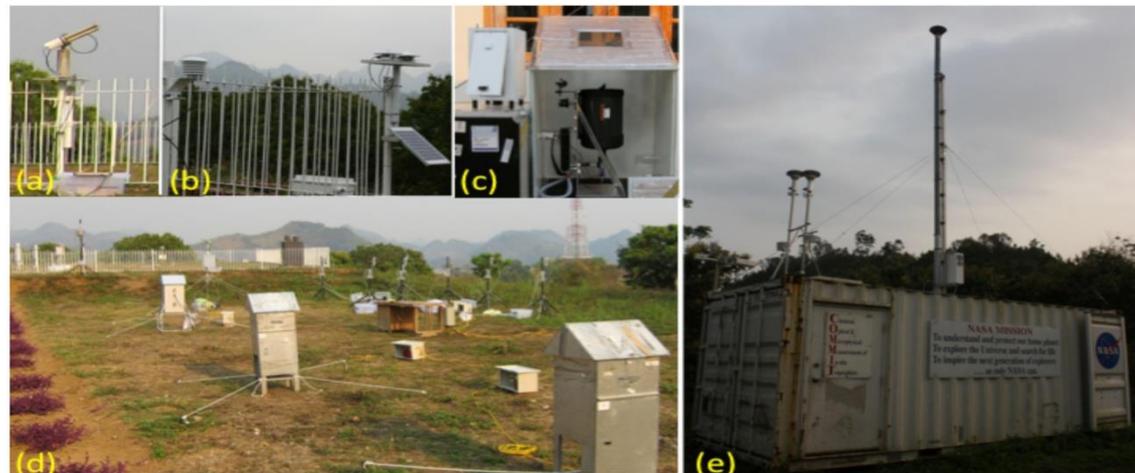

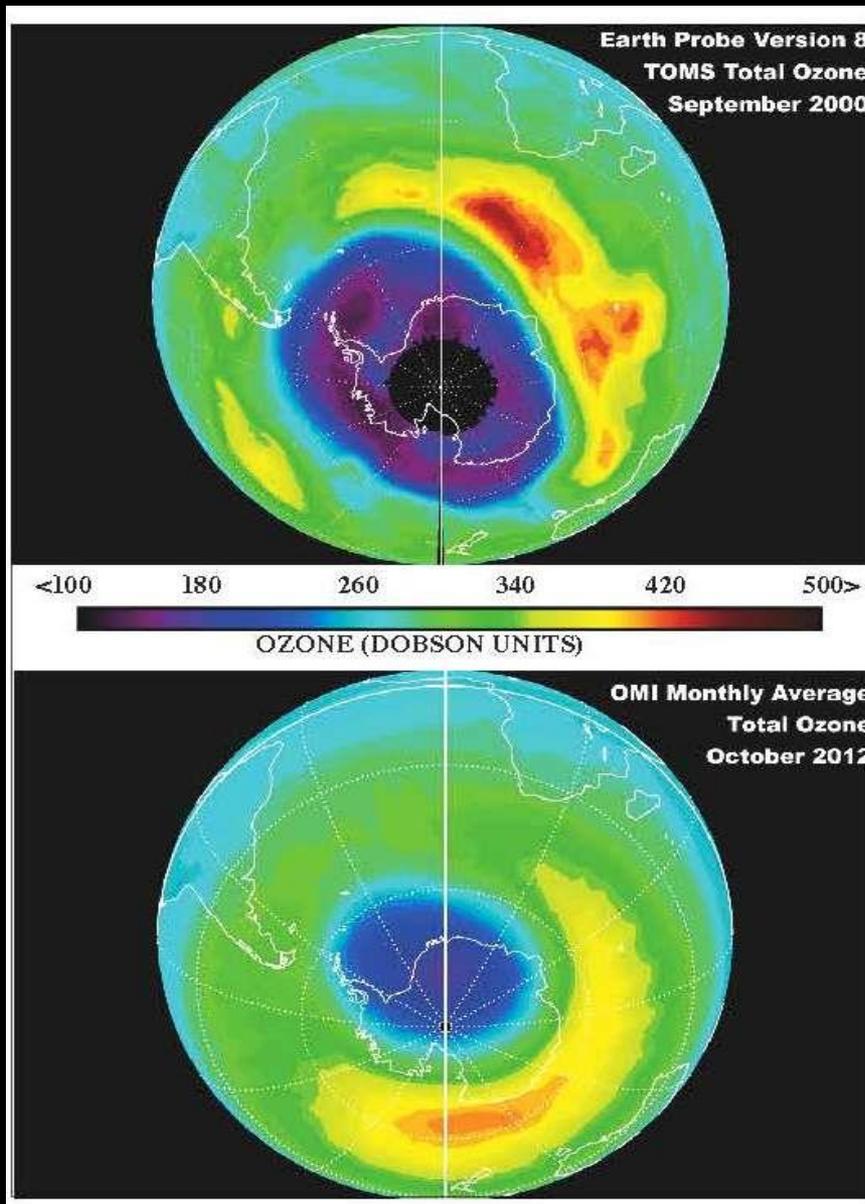

Figure 3. At the Son La supersite, COMMIT instrument setup for (a) AERONET/Cimel sunphotometer, TDE-corrected radiometer set, (c) dual-channel (355 & 532 nm) lidar from Taiwan, (d) second set of chemistry probes from the Taiwan team, as of Figure 2c, and (e) the COMMIT mobile laboratory.

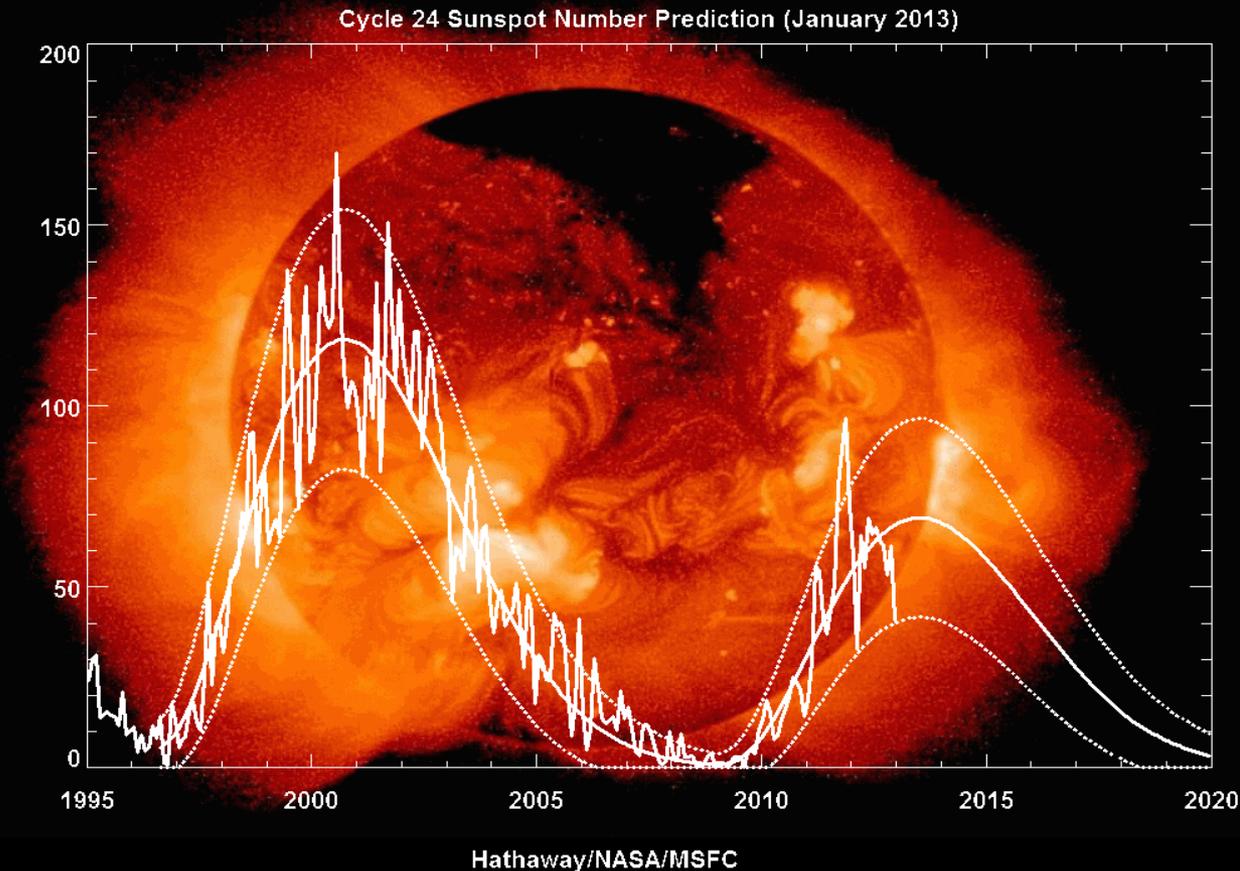

## Ozone Hole monitoring process studies, and modeling

Smallest ozone hole in the last 20 years detected in 2012 (bottom), about 62% areal coverage compared to the largest observed in 2000

Interannual fluctuations associated with strong stratospheric warming

Solar Radiation and Climate Experiment (SORCE), launched Jan,2003  
Total solar irradiance (TSI), Solar Spectral irradiance (SSI)

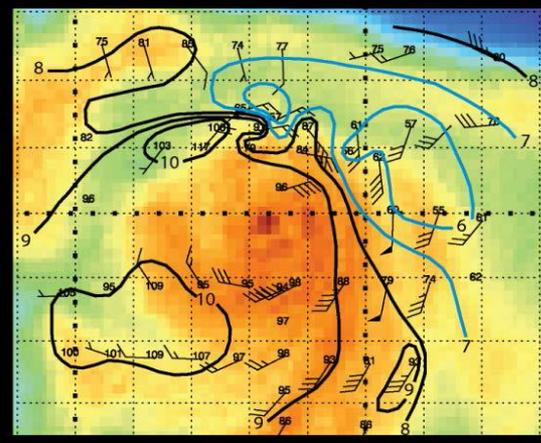

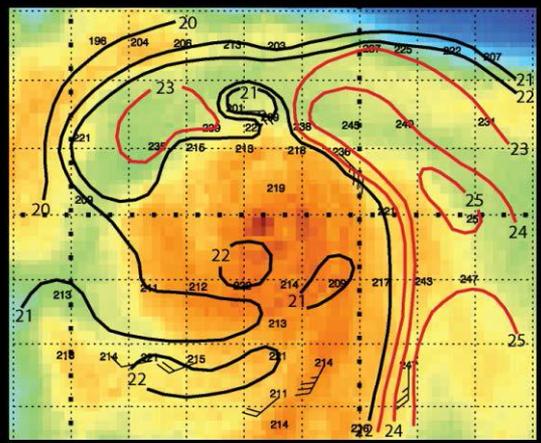

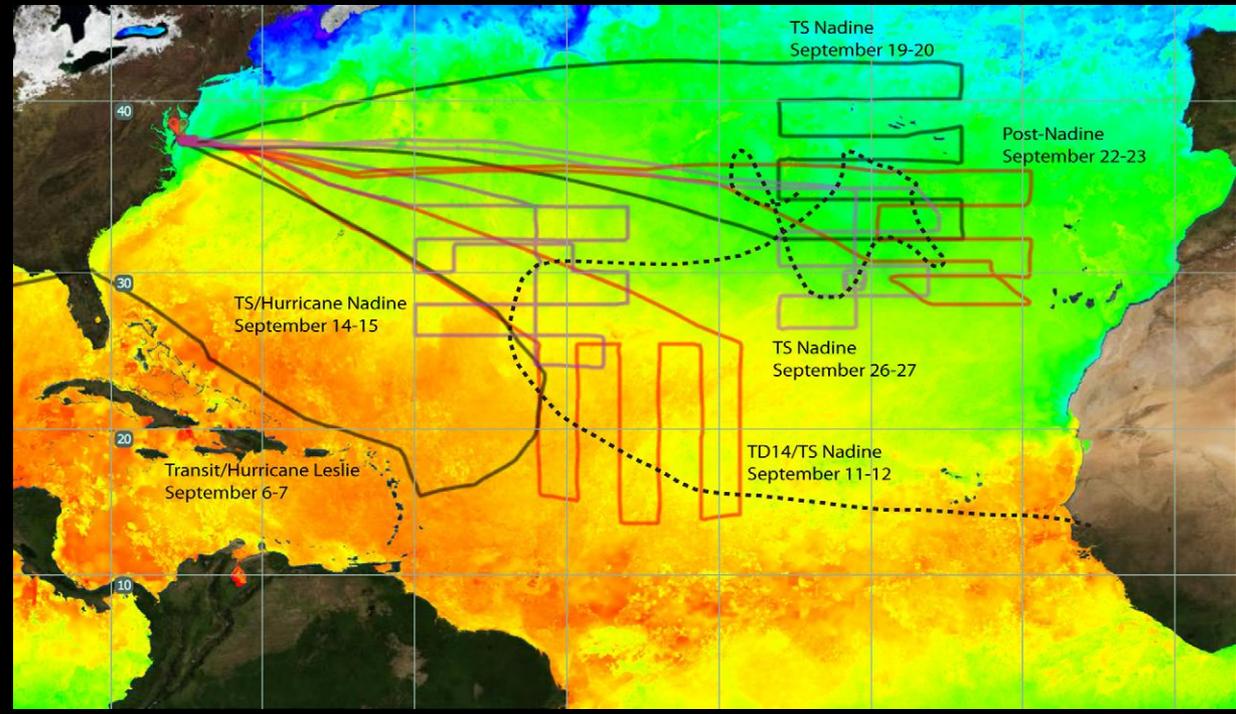

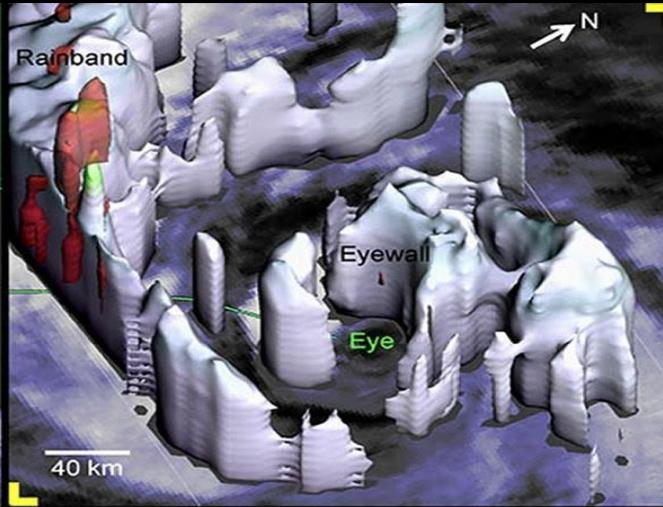

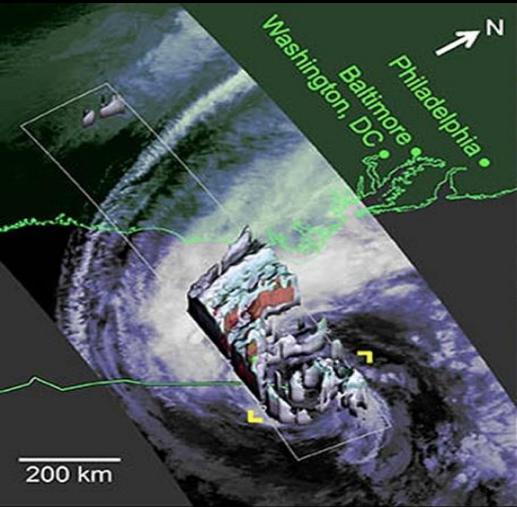

*Solar irradiance variations since 1995. SORCE has tracked the decline of solar irradiance in solar cycle 23, through the solar cycle minimum in 2008, and is now entering the maximum phase of solar cycle 24, at least according on predictions of sunspot numbers.*

# The Hurricane and Severe Storm Sentinel (HS3) — Preliminary Findings

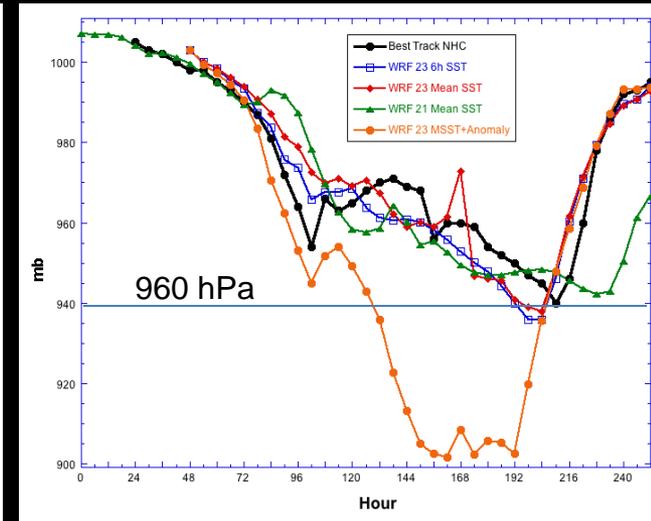

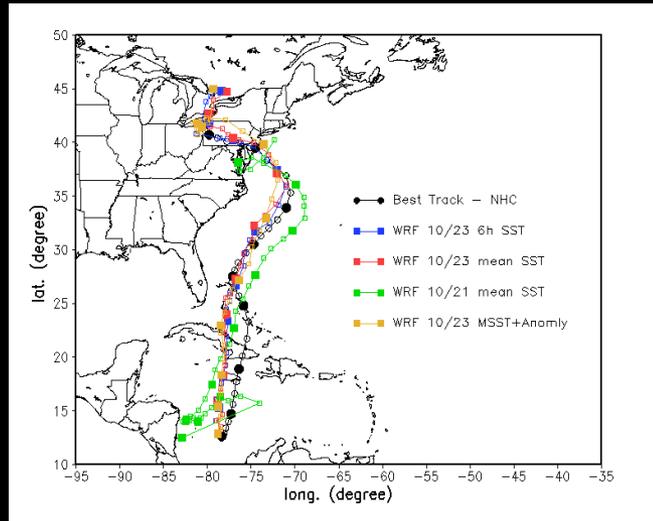

Scott Braun & Paul Newman, NASA GSFC

TRMM observation of 3-D structure of Hurricane Sandy, 28 Oct 2012

Nu-WRF model simulation of [Hurricane Sandy](#) under a  $2xCO_2$  world

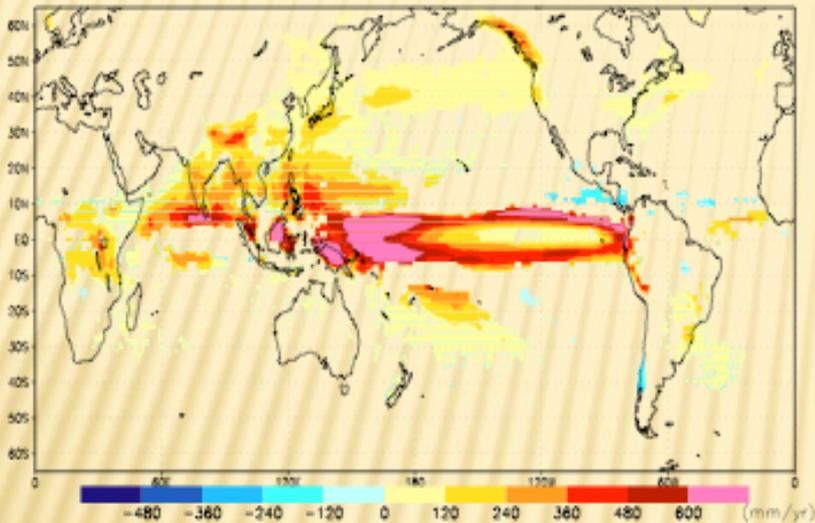

Under a warmer SST in a double  $CO_2$  world, Hurricane Sandy would have moved faster, making land fall 20 hrs earlier in slightly northerly position, with more than 70% increase in max surface pressure depression, lasting over 48 hrs longer, relative to present-day maximum ...

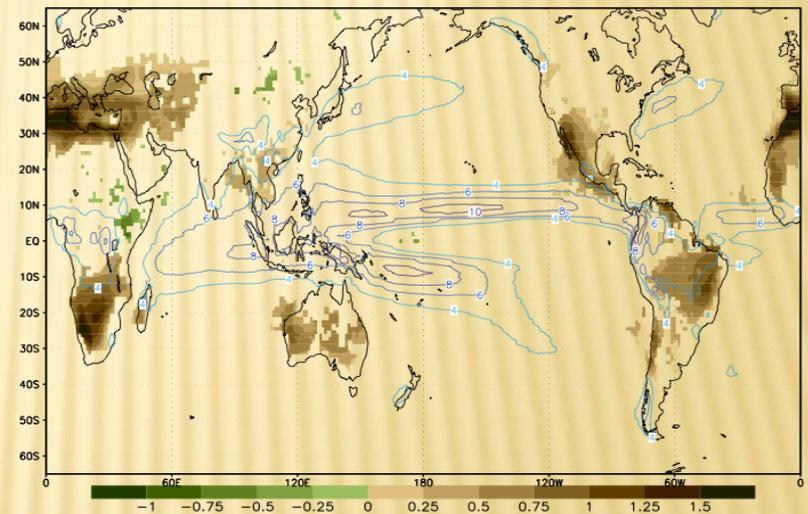

# Rolling the Climate Dice: Extreme rainfall and prolonged droughts due to CO<sub>2</sub> warming

(Lau et al. 2013, *GRL*)

**B Extreme rainfall**

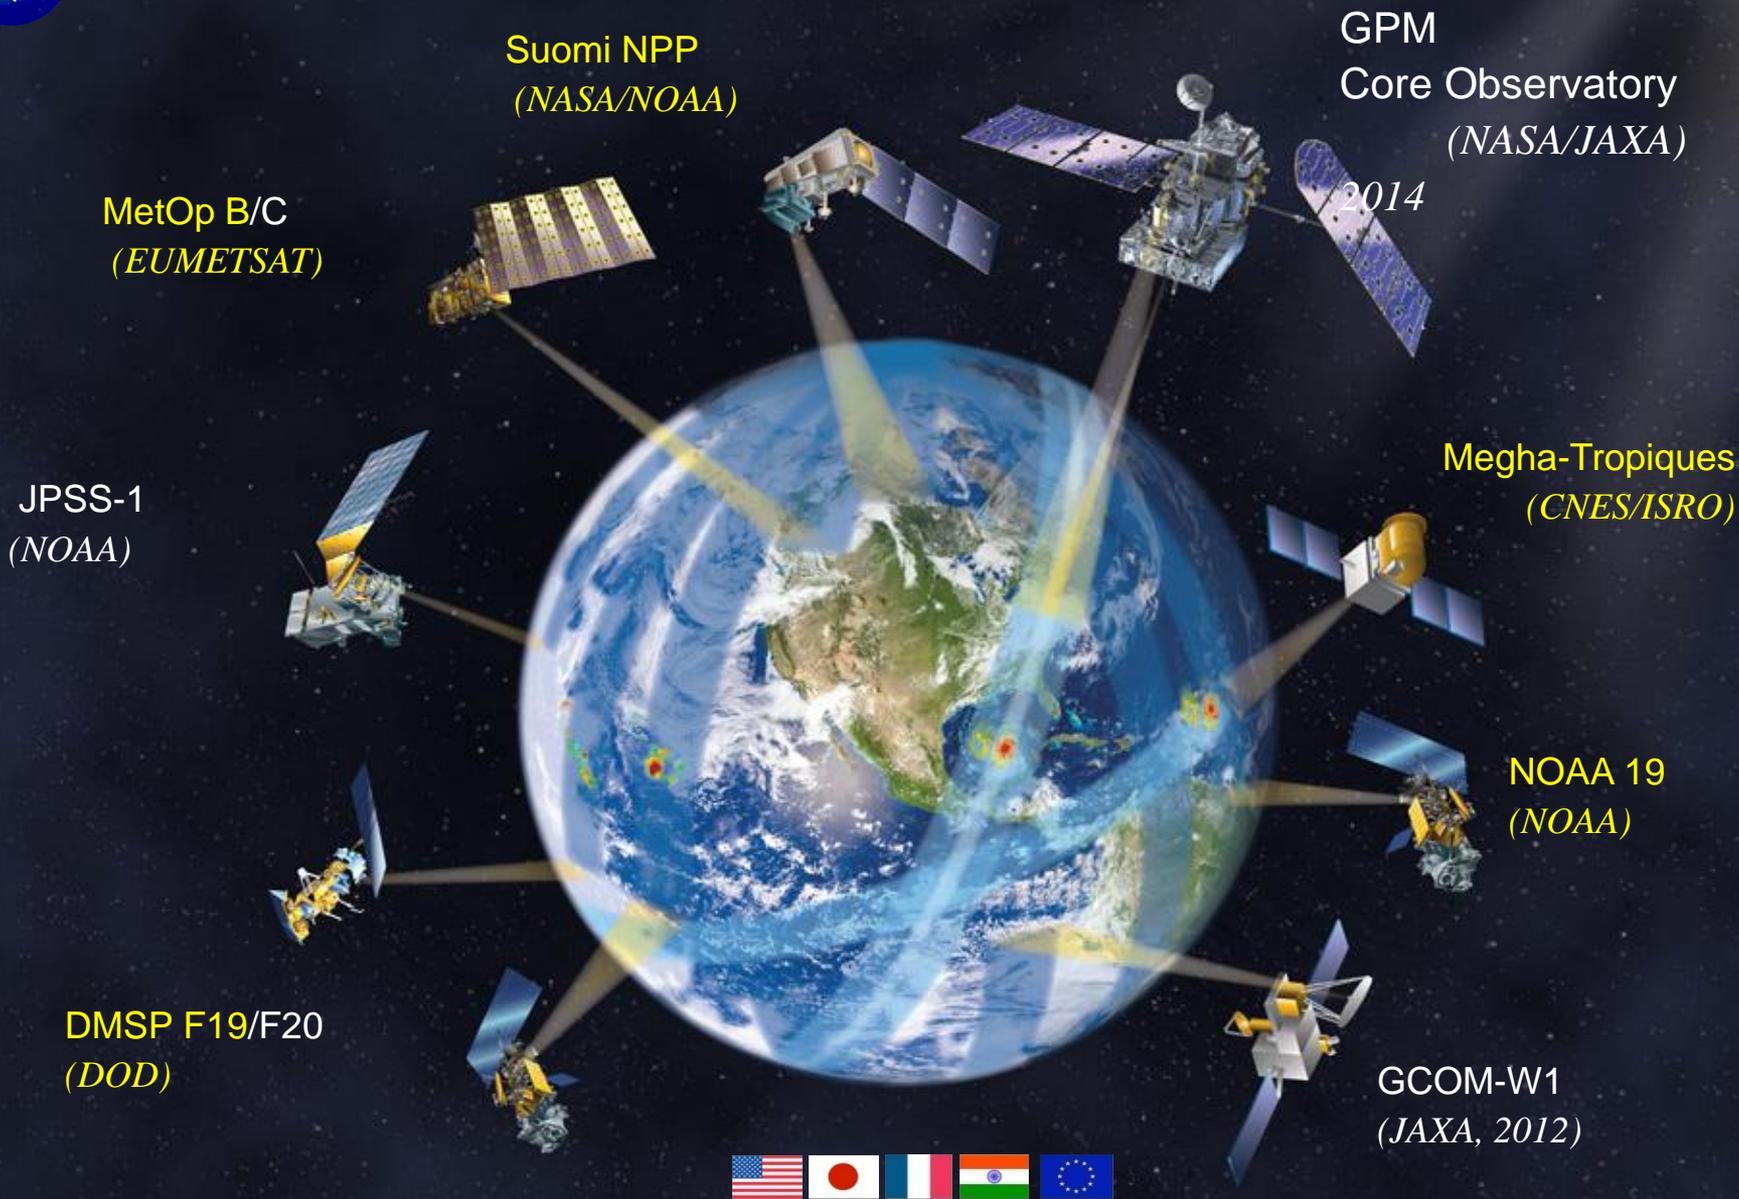

**Prolonged drought**

- More heavy rainfall, less moderate rain, and prolonged no-rain periods (drought)
- Extreme rainfall and severe drought are connected, occurring in preferred geographical locations
- Wet areas getting wetter, dry areas drier, and marginal convective zones over land getting drier too.

# GPM Constellation of Satellites

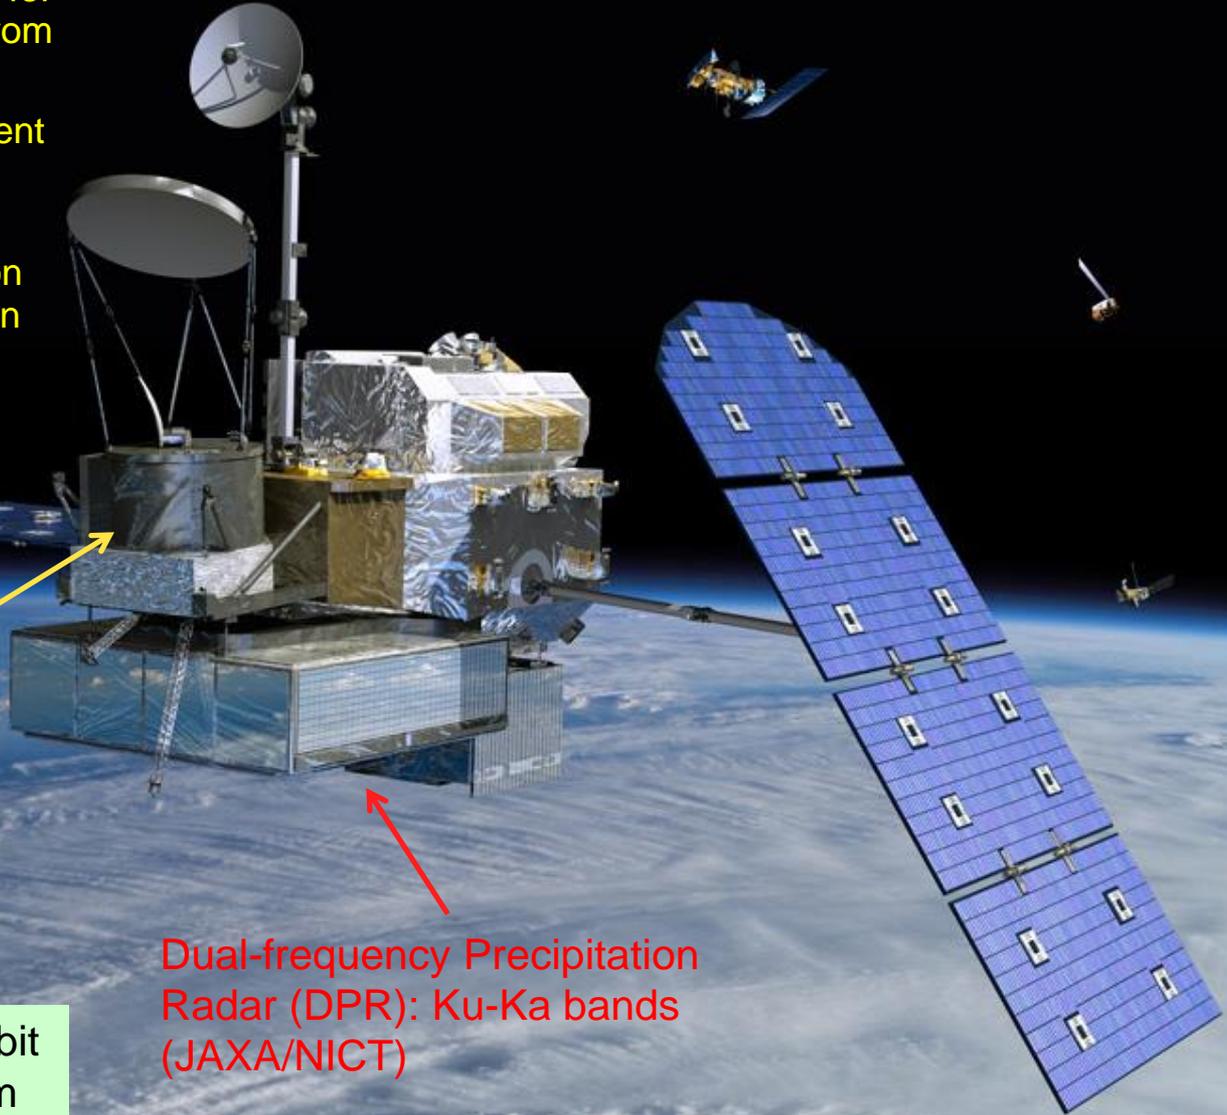

Next-Generation Unified Global Precipitation Products Using GPM Core Observatory as Reference

# Role of GPM Core Observatory

- Set a new reference standard for precipitation measurements from space
- Provide observations at different times of the day to improve constellation sampling
- Unify and improve precipitation estimates from all constellation radiometers

GPM Microwave Imager (GMI): 10-183 GHz (NASA)

Dual-frequency Precipitation Radar (DPR): Ku-Ka bands (JAXA/NICT)

Non-Sun-Synchronous orbit at 65° inclination & 407 km

# Next-Generation Global Precipitation Products

- **Intercalibrated constellation radiometric data reconciling differences in center frequency, viewing geometry, resolution, etc.**
  - Converting observations of one satellite to virtual observations of another using non-Sun-synchronous satellite as a transfer standard
  - International working group (NASA, NOAA, JAXA, CONAE, CMA, EUMETSAT, CNRS, GIST, & universities) in coordination with WMO/CGMS GSICS
- **Unified precipitation retrievals using a common cloud database constrained by DPR+GMI measurements from the Core Observatory**

*Optimally matching observed  $T_b$  with simulated  $T_b$  from an a priori cloud database*

*Prototype radiometer retrieval using a database consistent with TRMM PR+TMI measurements*

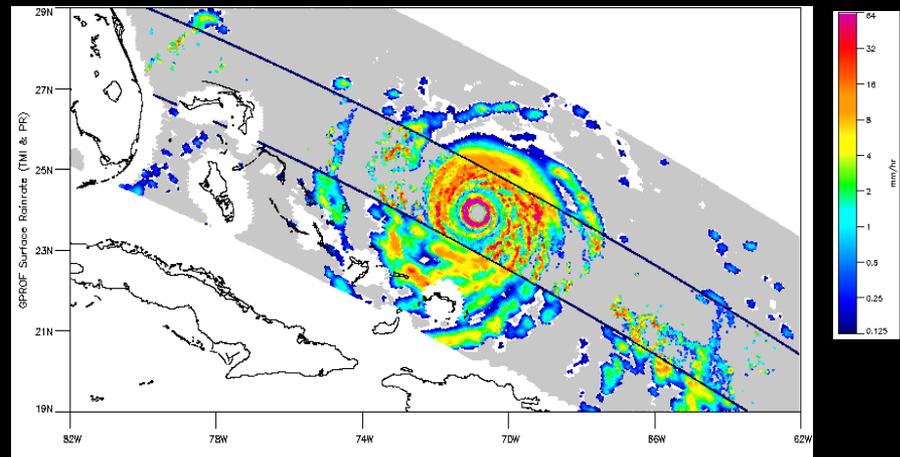

*Simulated  $T_b$*

*Observed  $T_b$*

*TRMM uses a model-generated cloud database*

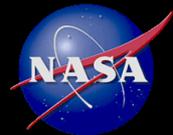

*GPM uses a DPR/GMI-constrained database*

Comparison of TRMM PR surface rain (inner swath) with TMI rain retrieval (outer swath)

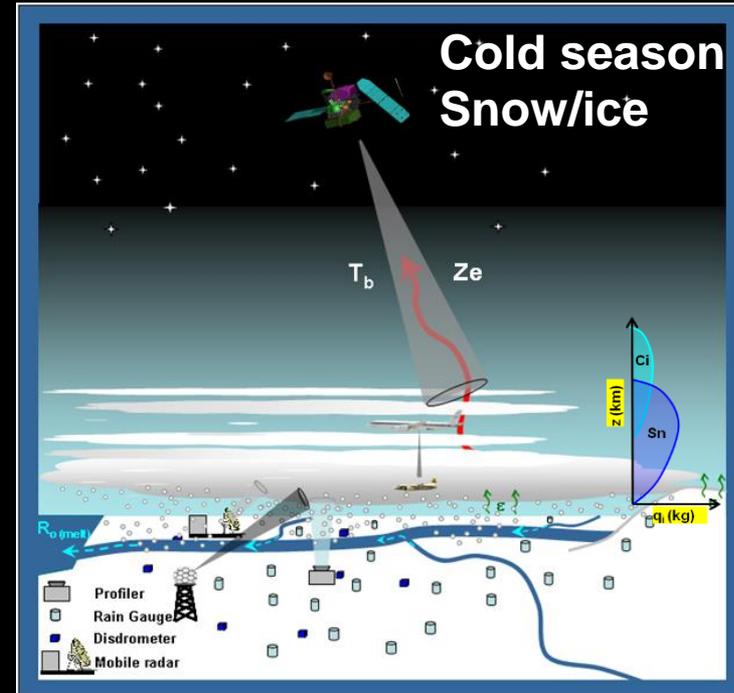

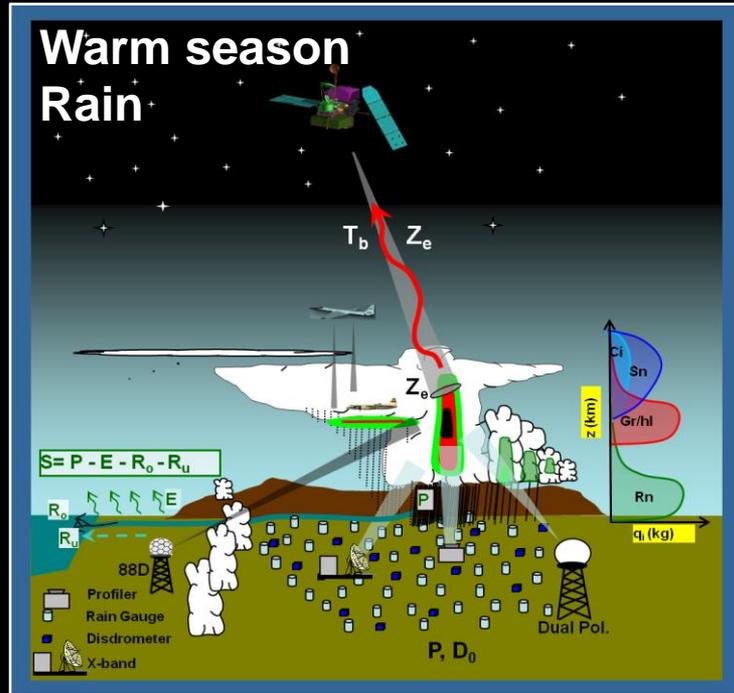

GPM Ground Validation

# GPM Ground Validation Science at WFF

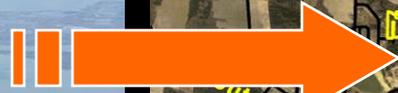

Walt Petersen, GPM GV Science Manager

- GPM retrieval algorithms must produce accurate precipitation estimates over a broad range of warm and cold season conditions- A difficult proposition!
- **GPM GV Disdrometer and Radar Observations of Precipitation “DROP” activities at WFF support local to global GPM Physical and Direct validation activities .**

# Wallops 6000 Acre Campus

**Main Base**

**Wallops Island**

# GPM WFF Network (keeping instruments busy doing science at "home")

- Phase 1: Gauges, NPOL, WSR-88D (already there)
- Phase 2: Disdrometers, MRR, D3R, SPANDAR
- Phase 3: Domain/methods extension

**Driving Science:**

**Spatial Variability and Errors**

$$\text{Var}(R_r - R) = \text{Var}(R_r - R_g) - \text{Var}(R_g - R)$$

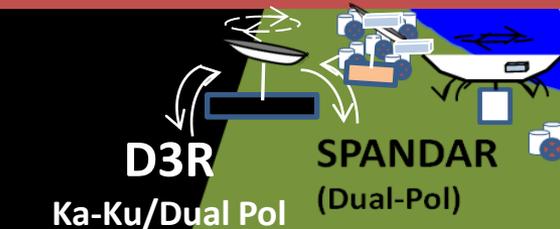

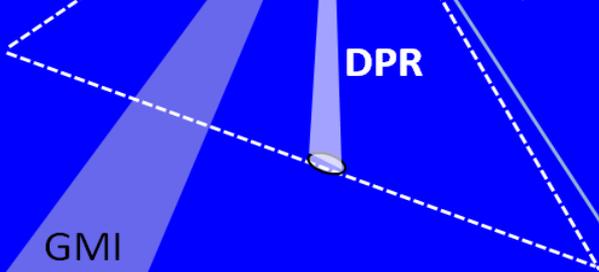

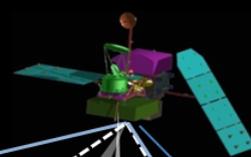

When/Why!- Column PHYSICS

**Sampling**

**Instrument limitations**

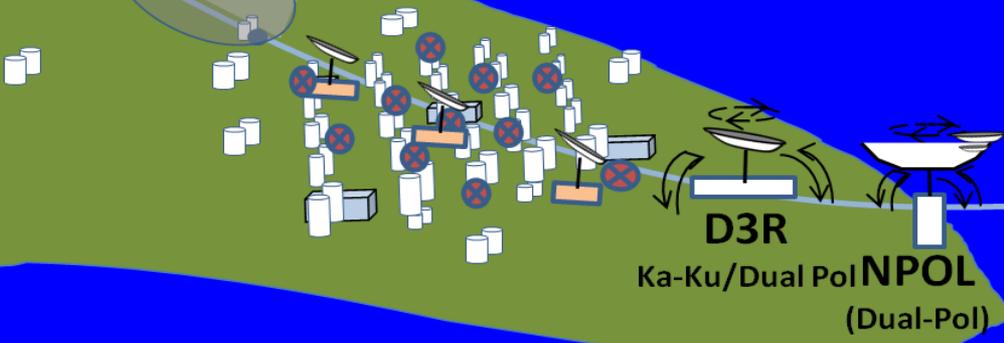

GPM Core Satellite Overpasses

Direct cal/val  
Algorithm Physics

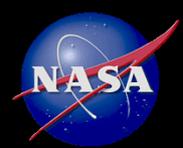

**DROP Network**  
(Rain gauge pairs, disdrometers, Micro Rain Radars)

-  Gauge pair
-  MRR
-  2DVD
-  JW or Parsivel

Ocean/Estuary component

# Key Infrastructure

## DROP Infrastructure (PMM: TRMM to GPM)

**Radars: Domain 4-D precip structure, DSD, rates**

NPOL Radar: S-band transportable, dual-pol, scanning

D3R radar: Dual-frequency (KA-KU), dual-polarimetric, Doppler radar.

TOGA C-band deployable Doppler radar

3 Metek Micro Rain Radars (K-band), vertically pointing

**Disdrometers/Gauges: DSD, particle imager, rain rate and rain/snow water**

5 2D Video Disdrometers

24 Parsivel laser disdrometer

8 Joss Waldvogel

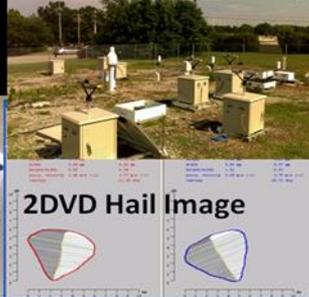

5 Precip Video Imagers (PVI)

100+ Met One rain gauges

7 Hot plate sensors – Snow (70 K)

9 OTT Pluvio<sup>2</sup> gauges – Snow (56 K)

DROP Farm (NSSTC)

NPOL Radar

D3R Radar

DROP Parsivels in Finland

DROP APU

Laser Disdrometer

Micro Rain Radar

Pluvio Weighing gauge

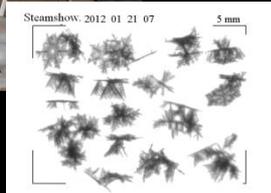

YES Hot Plate V2

Precip (PVI)

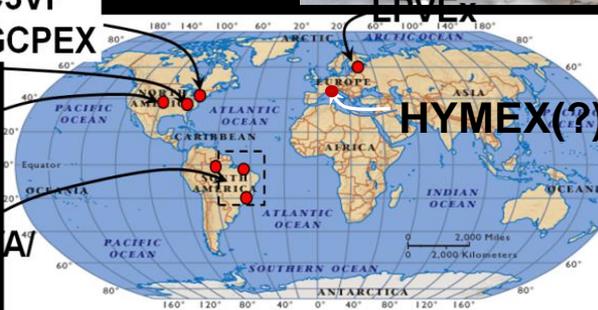

Rain Gauge

C3VP  
GCPEX

LPVEX

HYMEX(?)

**GPM Field Campaigns**

# NPP /JPSS NASA/NOAA Collaboration

NPP Launch: Oct 28, 2011

# NPP and JPSS-1 (LRD 11/2016)

Hyperspectral IR and Microwave  
Sounding

CrIS

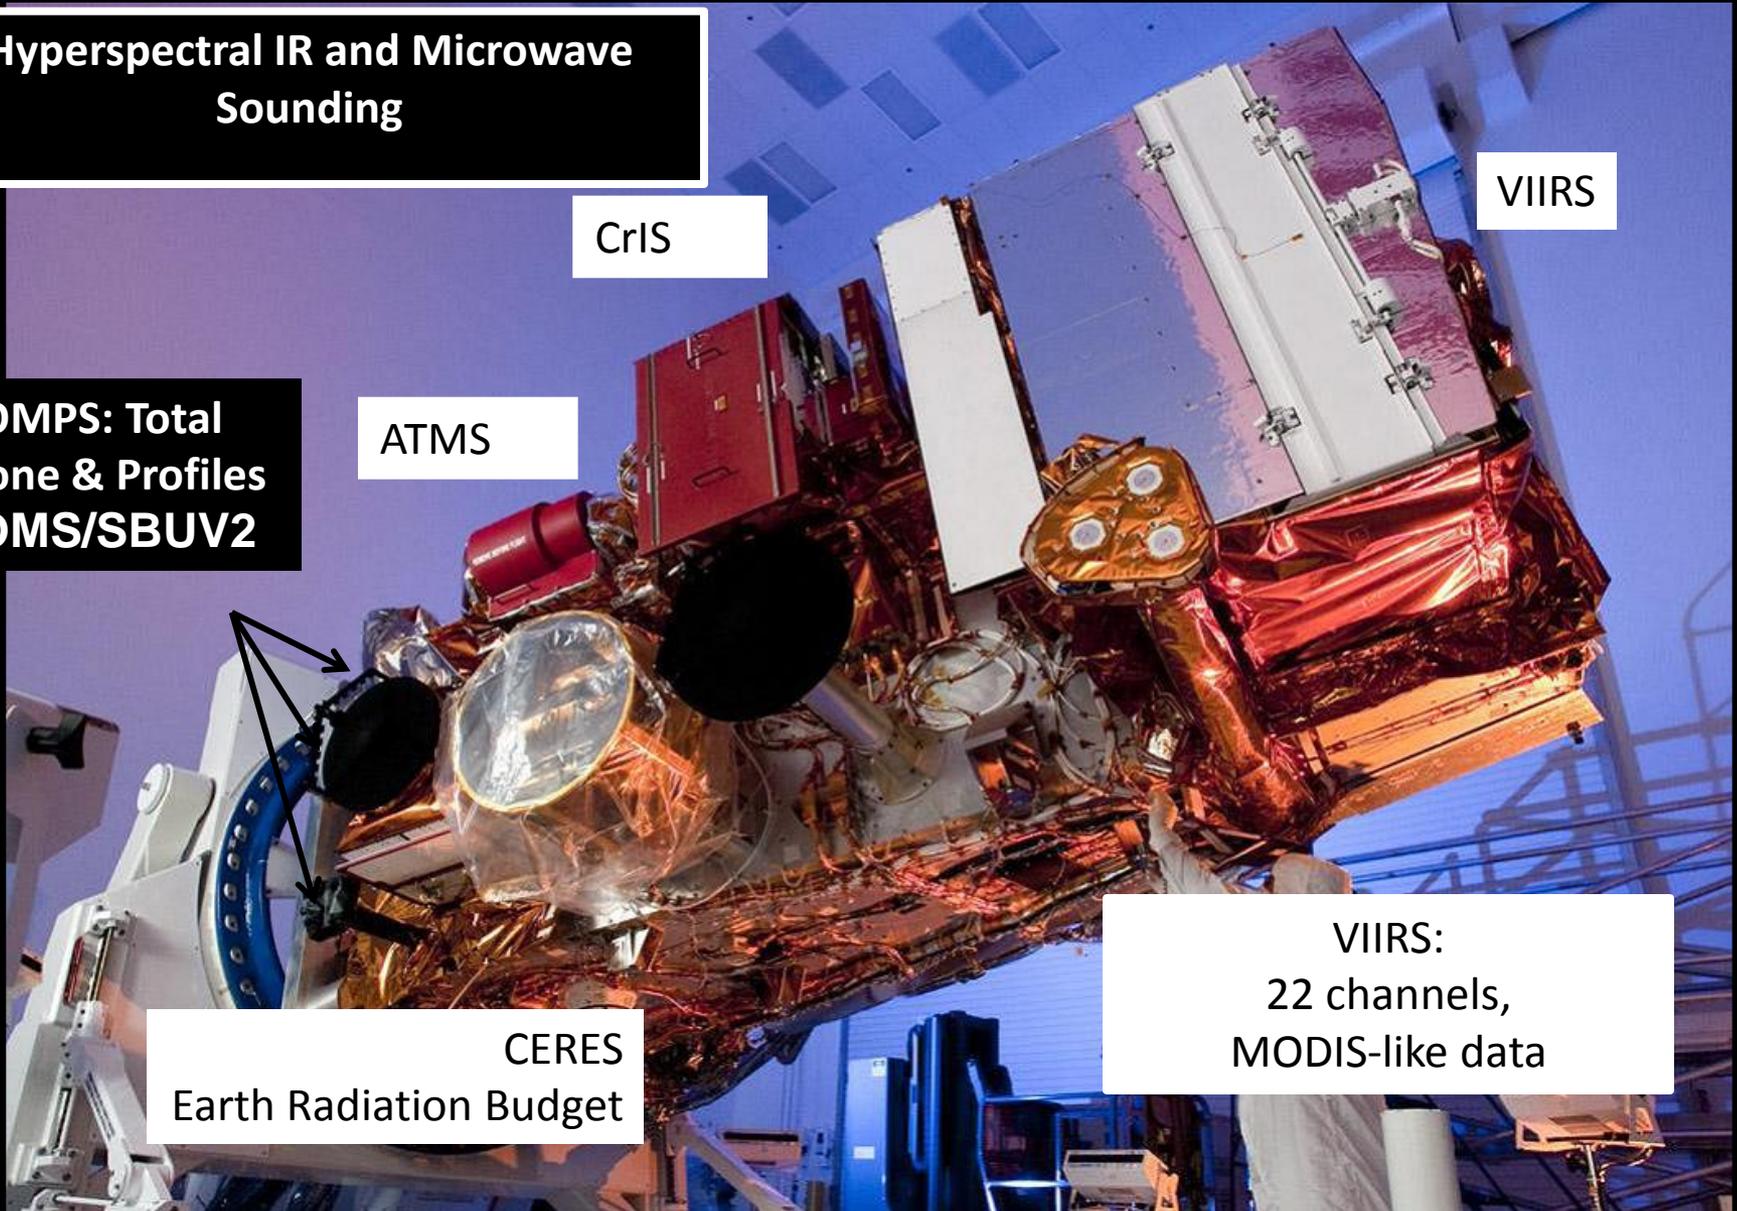

VIIRS

OMPS: Total  
Ozone & Profiles  
TOMS/SBUV2

ATMS

VIIRS:  
22 channels,  
MODIS-like data

CERES  
Earth Radiation Budget

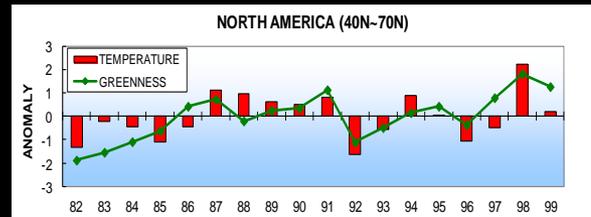

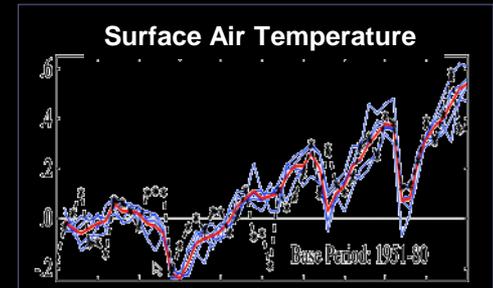

# Time Series Data to Reveal Global Change

Satellites: Nimbus/POES → EOS → **NPP** → JPSS

## How is the global Earth system changing?

- atmospheric temperature and moisture profiles
- vegetation responses to climate

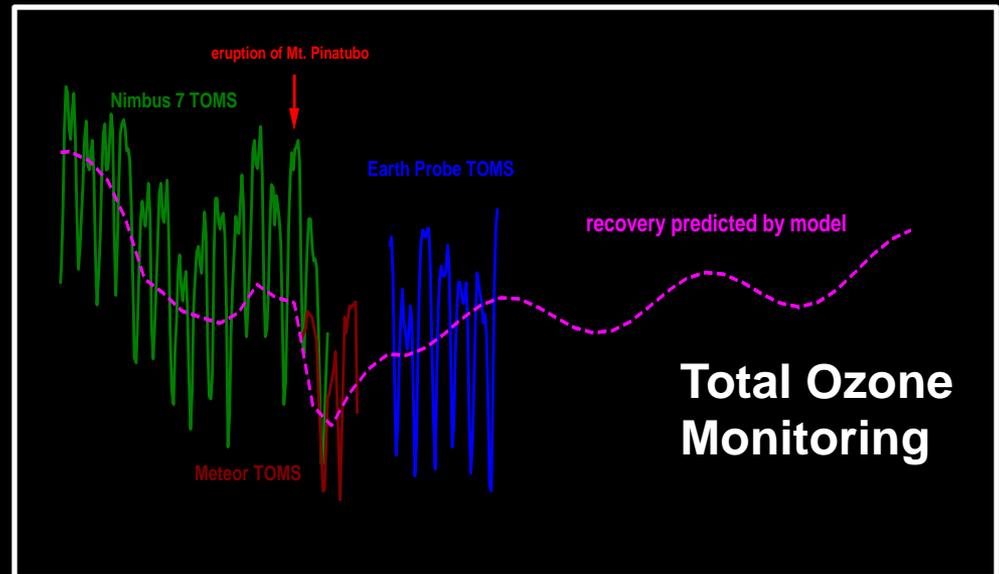

Atmospheric Sounding

Multispectral Imaging / Surface Biophysical Properties

## How does the Earth System respond to natural and human-induced changes?

- ozone layer recovery
- clouds and aerosols

Total Ozone Monitoring

NPP Commissioning Complete February 23, 2012

BACK UP

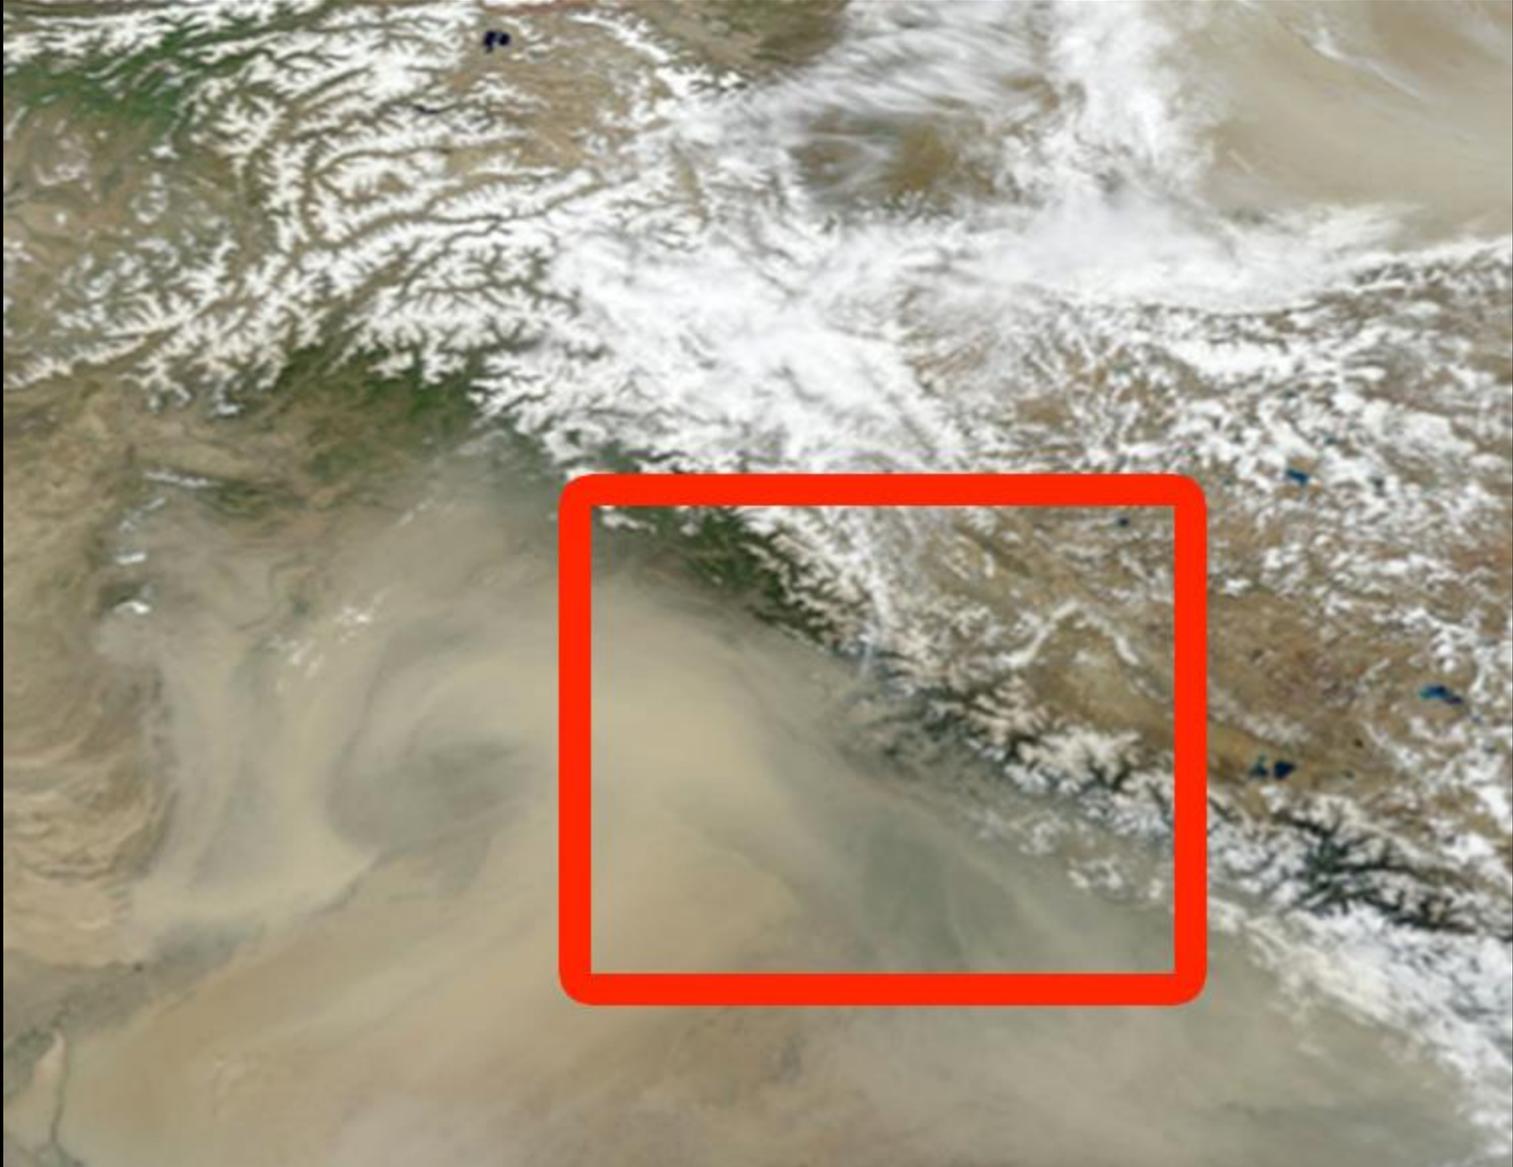

# Wallops and Code 610.W Mission

## Wallops Mission

- Enable scientific research through the development and deployment of low-cost, highly capable suborbital and orbital research carriers, project management, and mission services.
- Enable aerospace technology advances supporting NASA’s Science, Exploration Systems, and Aeronautics Mission Directorates, through advanced technology development, testing, and operational support,
- Enable education, the commercial development of space, and other innovative partnerships by leveraging Wallops’ unique capabilities and expertise to collaborate with industry, academia, and other government agencies.

## Code 610.W Mission

- Support Earth Science research through the development, deployment, and collection of ground-based and sub-orbital earth science measurements and remote sensing instrumentation.
- Devise and conduct targeted cal/val activities for Earth Science missions
- Conduct research using Earth Science datasets, measurements and model simulations
- Support education, outreach, and technology applications as an extension of Wallops Earth Science activities

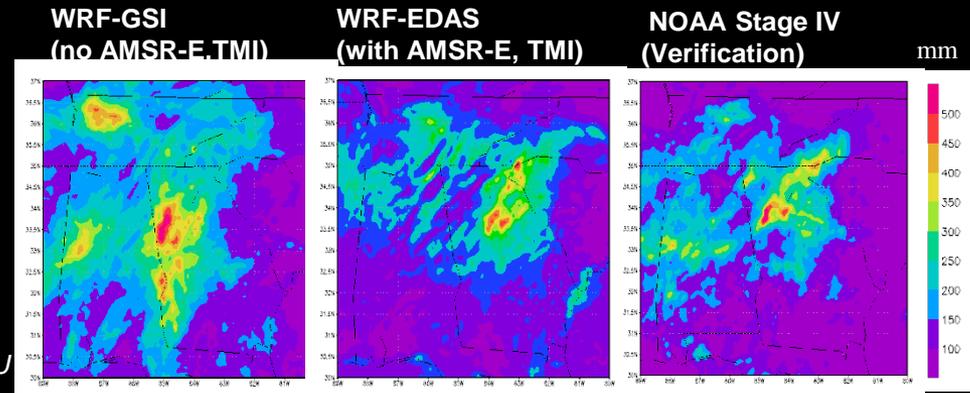

# Strategic Initiatives & Product Development

- Dynamic downscaling using cloud-resolving WRF ensemble data assimilation for hydrological applications

- Assimilation of rain-affected MW radiances (TMI, AMSR-E, MHS) into the NASA Unified WRF Ensemble Data Assimilation System improves precipitation analysis and short-term forecast.

NASA/GSFC & CSU

Rain accumulation for 15-22 Sept. 2009 over Southeast US flood region

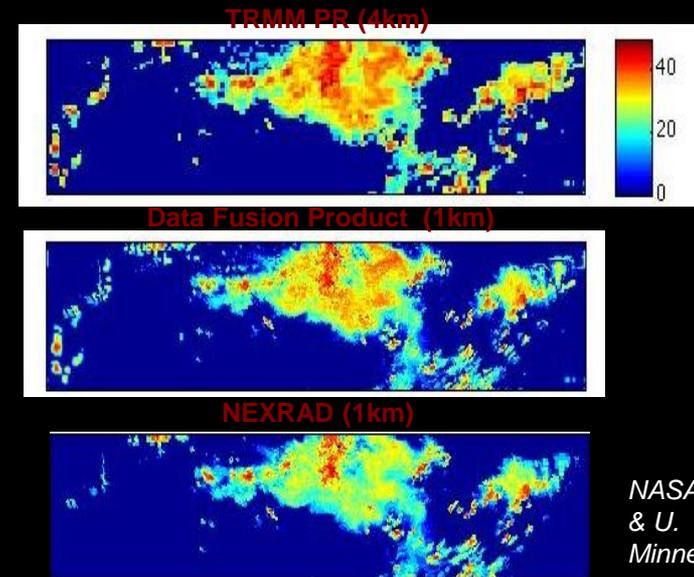

- Variable-resolution global precipitation product via data fusion of satellite and ground measurements within the framework of probabilistic estimation and sparse representation

- Statistical characterizations of observation errors at native scales as a function of surface type, geographic location, season, and rain intensity.

- Optimal non-Gaussian estimation and filtering using wavelet decomposition that preserves precipitation extremes at native measurement scales.

- Data fusion at multi-scales according to uncertainties of individual data types

NASA/GSFC  
& U.  
Minnesota
